ΘΕΜΑ Β

B1.

Για σύστημα ράβδου – μάζας

$$\Sigma \tau = I_p \cdot \alpha_{\gamma\omega\nu} \Rightarrow \frac{M}{2} g \cdot L + Mg \frac{L}{2} = \left(\frac{1}{3} ML^2 + \frac{M}{2} L^2 \right) \cdot \alpha_{\gamma\omega\nu} \Rightarrow$$

$$\Rightarrow M \cdot g \cdot L = \frac{5}{6} M \cdot L^2 \cdot \alpha_{\gamma\omega\nu} \Rightarrow \alpha_{\gamma\omega\nu} = \frac{6g}{5L}.$$

Για τη ράβδο

$$\frac{\Delta L}{\Delta t} = \Sigma \tau_{\rho\alpha\beta} = I_{\rho\alpha\beta} \cdot \alpha_{\gamma\omega\nu} = \frac{1}{3} ML^2 \cdot \frac{6g}{5L} = \frac{2}{5} MgL.$$

Άρα σωστό το iii.

B2.

Η απόσταση του M από το O (αρχή x = 0):

$$x_M = 2 \frac{\lambda}{2} + \frac{\lambda}{4} + \frac{\lambda}{12} = \frac{16}{12} \lambda = \frac{4}{3} \lambda$$

Το πλάτος:

$$A' = \left| 2A \cdot \sigma\upsilon\nu \frac{2\pi x_M}{\lambda} \right| = \left| 2A \cdot \sigma\upsilon\nu \frac{2\pi \cdot 4\lambda}{3\lambda} \right| \Rightarrow A' = \left| 2A \cdot \sigma\upsilon\nu \frac{8\pi}{3} \right| = \left| 2A \cdot \sigma\upsilon\nu \left(\frac{6\pi + 2\pi}{3} \right) \right| =$$

$$= \left| 2A \cdot \sigma\upsilon\nu \left(\frac{2\pi}{3} \right) \right| = \left| -2A \cdot \frac{1}{2} \right| = A.$$

Άρα το πλάτος είναι $A' = A$.

$$\frac{D_2}{k} = \frac{m_2}{m_1 + m_2}$$

$$D_2 = \frac{m_2}{m_1 + m_2} k \quad (2)$$
